

Work Support, Self-Locking with pneumatic position monitoring, double acting, max. operating pressure 500 bar

Application

Hydraulic work supports are used to provide a self-adjusting rest for the workpiece during the machining operations. They compensate the workpiece surface irregularities, also vibration and deflection under machining loads.

Hydraulic locking is made together with hydraulic clamping of the workpiece, or independently.

Due to the self-locking function of the support plunger, these work supports are particularly suitable for:

- Manufacturing systems with pallet store
- Clamping fixtures with workpiece loading via handling systems
- Transfer lines
- Automatic manufacturing systems
- Assembly lines
- Indexing machines
- Special machine tools

Important notes

If there is any danger of fluids being sucked into the filter, a vent hose has to be connected at the bleeding port (M5).

The standard contact bolt in the support plunger protects the interior against contamination. All versions, except 1933-025, are equipped with a pressure spring below the contact bolt. Please ask for installation dimensions, if you will use self-manufactured contact bolts.

To unlock the support plunger the min. unclamping pressure as per diagram, page 2, is required.

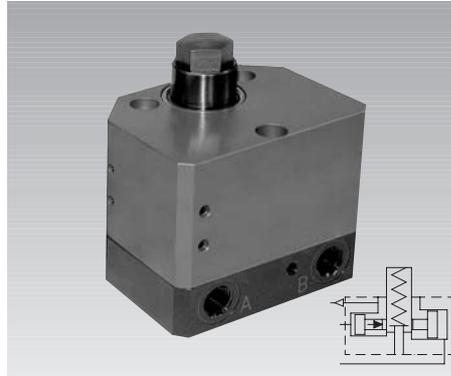

Support and clamping forces have to be coordinated to provide the work support with a sufficient force reserve for absorption of machining forces.

Thumb rule:

Support force $\geq 2 \times$ clamping force

The self-locking is not form-fit. The introduction of impact machining forces has to be avoided. Max. retention force see diagram.

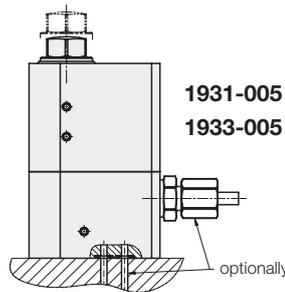

Operating conditions, tolerances and other data see data sheet A 0.100.

Function

There are two variations of plunger actuation:

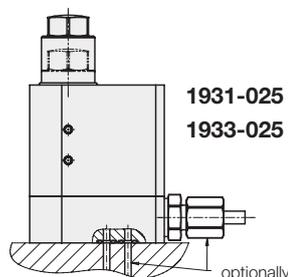

1. Off-position retracted

When pressurising the element, the support plunger moves forward with a light spring force against the workpiece. Then locking is automatically effected.

Advantage: Unimpeded loading and unloading of the clamping fixture!

2. Off-position extended

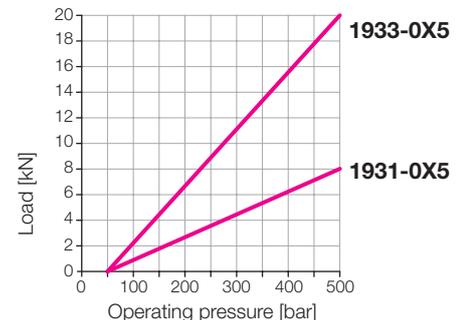

When loading the fixture, the support plunger is pushed back by the workpiece and contacts the workpiece by spring force. Then hydraulic locking can be effected. During unclamping the support plunger will be unlocked and moved forward by a little spring force when unloading the workpiece.

Advantage: Compact design.

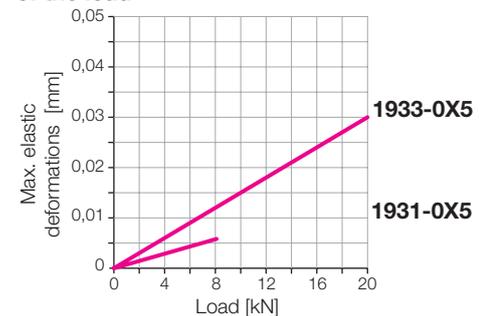

Advantages

- No yielding at the workpiece, even if pressure drops, due to patented locking with self-locking function.
- Very little elasticity of the support plunger (see diagram).
- No axial displacement of the support plunger during locking.
- Compensation of side loads, if a clamping element clamps directly onto the workpiece (see application example).
- Optimum adaptation to the workpiece due to asymmetrical shape of the body.
- Little contact force to the workpiece due to spring force.
- Oil supply optionally via fittings or drilled channels
- Higher process safety due to integrated pneumatic position monitoring as well as hydraulic retraction of the support bolt.
- Mounting position: any
- Standard FKM seals

Admissible load as function of the operating pressure

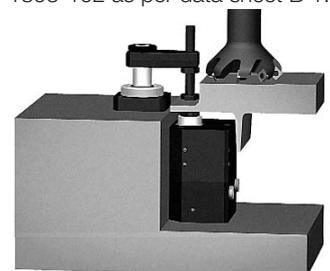

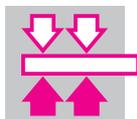

Max. elastic deformations as a function of the load

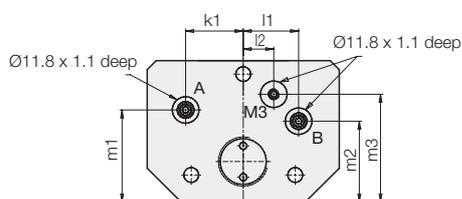

Application example

Manifold-mounted work support with swing clamp 1893-102 as per data sheet B 1.8803.

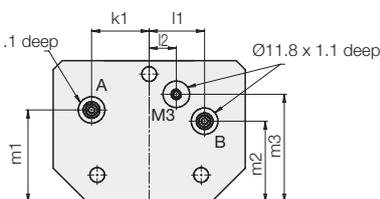

Off-position retracted 1931-005 1933-005

Off-position extended 1931-025 1933-025

A = Extending and locking
B = Unlocking and retracting

Notes:

1. Manifold mounting

For manifold mounting remove screw with sealing (see bottom) and insert O-ring 9x1.5 (part-no. 3001-305) into the counterbore.

Connecting hole max. Ø 7 mm. Screw in plug G 1/4 or G 1/8 (part-no. 3610-006 or 3610-008).

2. Pneumatic position monitoring

To operate the position monitoring, remove the set screws (M5) and screw in insertion nipple fitting (part-no. 3890-091) or L-type insertion nipple fitting (part-no. 3890-094).

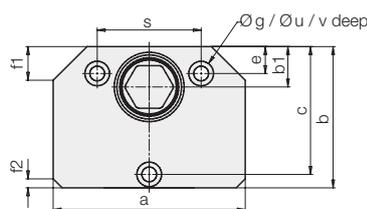

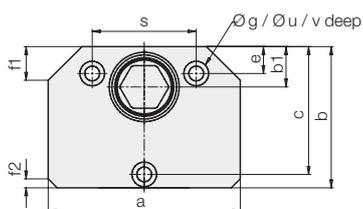

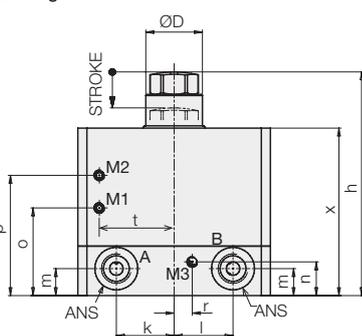

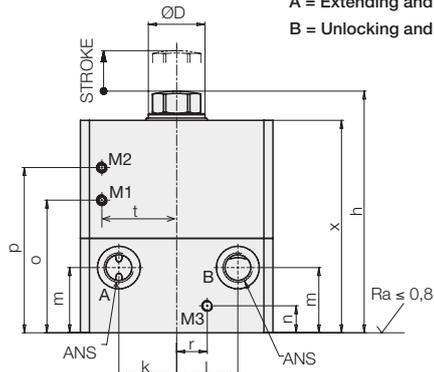

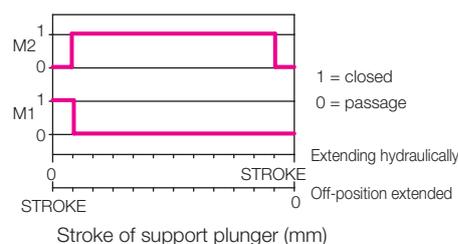

M1 – support plunger retracted, thread M5.

M2 – support plunger extended, thread M5.

M3 – do not close bleeding port, thread M5 (see important notes).
